## Effects of Low-Level Air Pollution: A Study in Europe

**Bert Brunekreef**, Maciej Strak, Jie Chen, Marjan Tewis, Zorana Andersen, Richard Atkinson, Mariska Bauwelinck, Tom Bellander, Marie-Christine Boutron, Giulia Cesaroni, Claire Demoury, Francesco Forastiere, Daniela Fecht, John Gulliver, Frauke Hennig, Ole Hertel, Barbara Hoffmann, Kees de Hoogh, Danny Houthuijs, Ulla Hvidtfeldt, Nicole Janssen, Jeanette Jørgensen, Klea Katsouyanni, Matthias Ketzel, Jochem Klompmaker, Vittorio Krogh, Shuo Liu, Petter Ljungman, Gabriele Nagel, Bente Oftedal, Carsten Pedersen, Göran Pershagen, Annette Peters, Ole Raaschou-Nielsen, Sophia Rodopoulou, Evi Samoli, Per Schwarze, Gianluca Severi, Torben Sigsgaard, Massimo Stafoggia, Danielle Vienneau, Gudrun Weinmayr, Kathrin Wolf and **Gerard Hoek**

## Background

Uncertainty about associations between air pollution and health at low concentrations

## Objectives

Investigate associations between long-term exposure to PM<sub>2.5</sub>, NO<sub>2</sub>, O<sub>3</sub>, BC and:

- Natural and cause-specific mortality
- Incidence of lung cancer and cardiovascular events

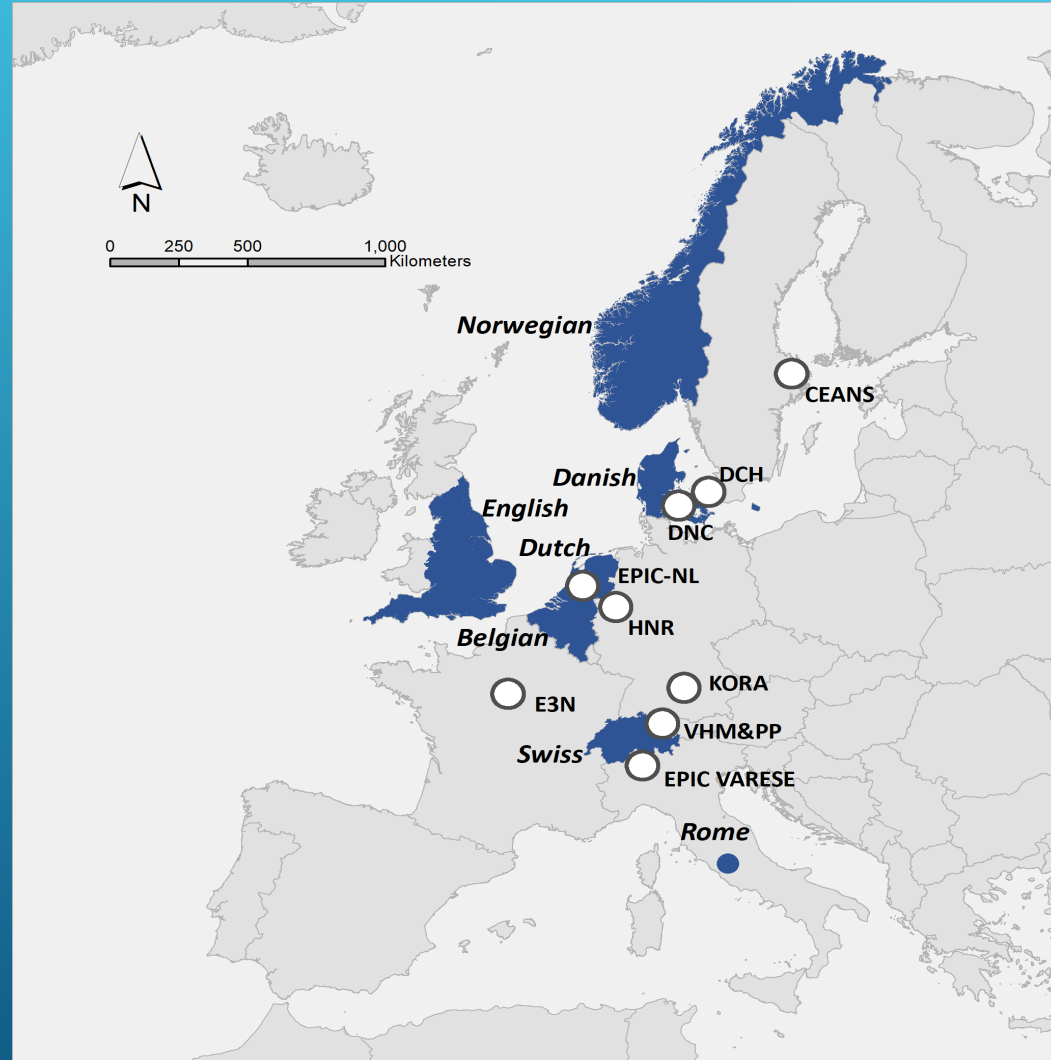

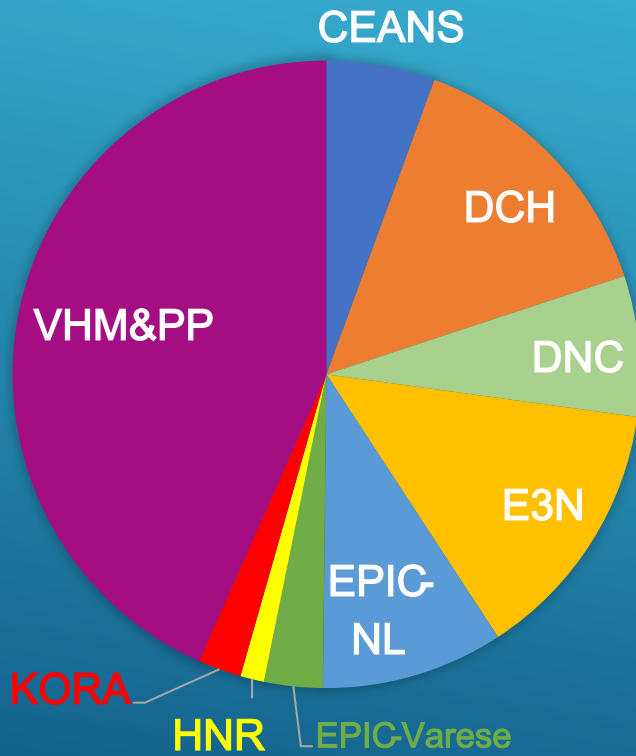

## Methods

- Low-level defined as below current limit values
- Pooling nine European cohorts (eight ESCAPE and Danish Nurse Cohort) (N = 400 thousand adults )
- Large administrative cohorts from seven countries in Europe (N = 28 million adults )

## Standardization of methods

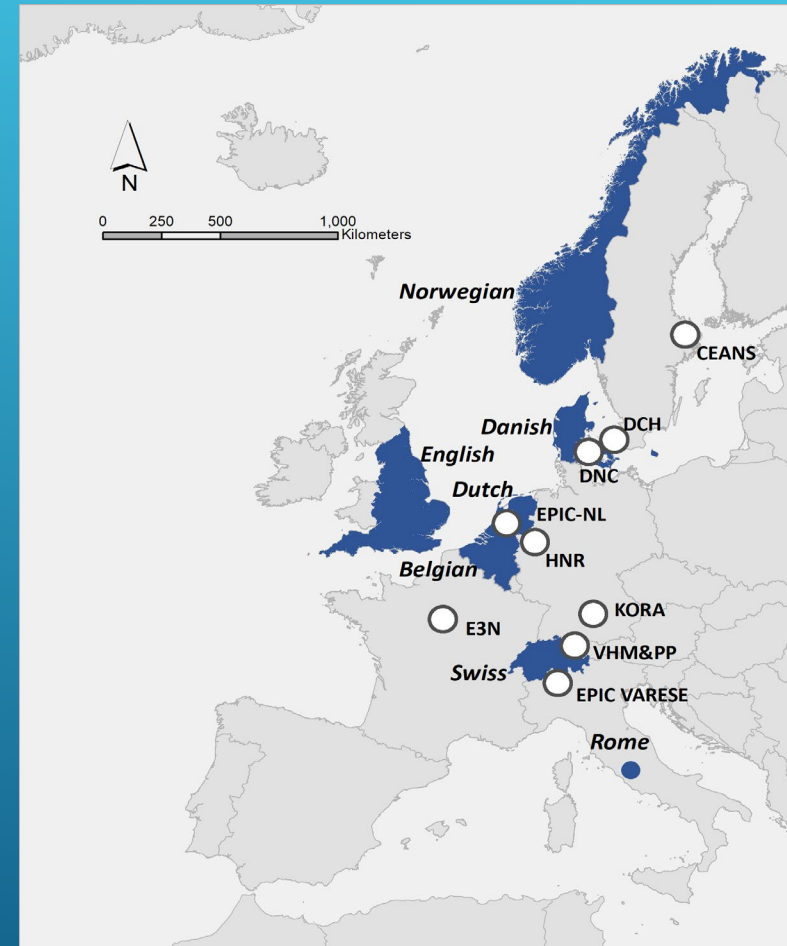

- Definition of endpoints and covariates
- Central exposure assessment of PM<sub>2.5</sub>, NO<sub>2</sub>, O<sub>3</sub> and BC at fine spatial scale
- Data analysis (same R script)

## Pooled cohort

- N = 392,826
- Extensive covariate information

## Administrative cohorts

- $N = 27,910,693$
- Limited covariate info (except English)
- Analyzed individually -> Meta-analysis

## Central exposure assessment

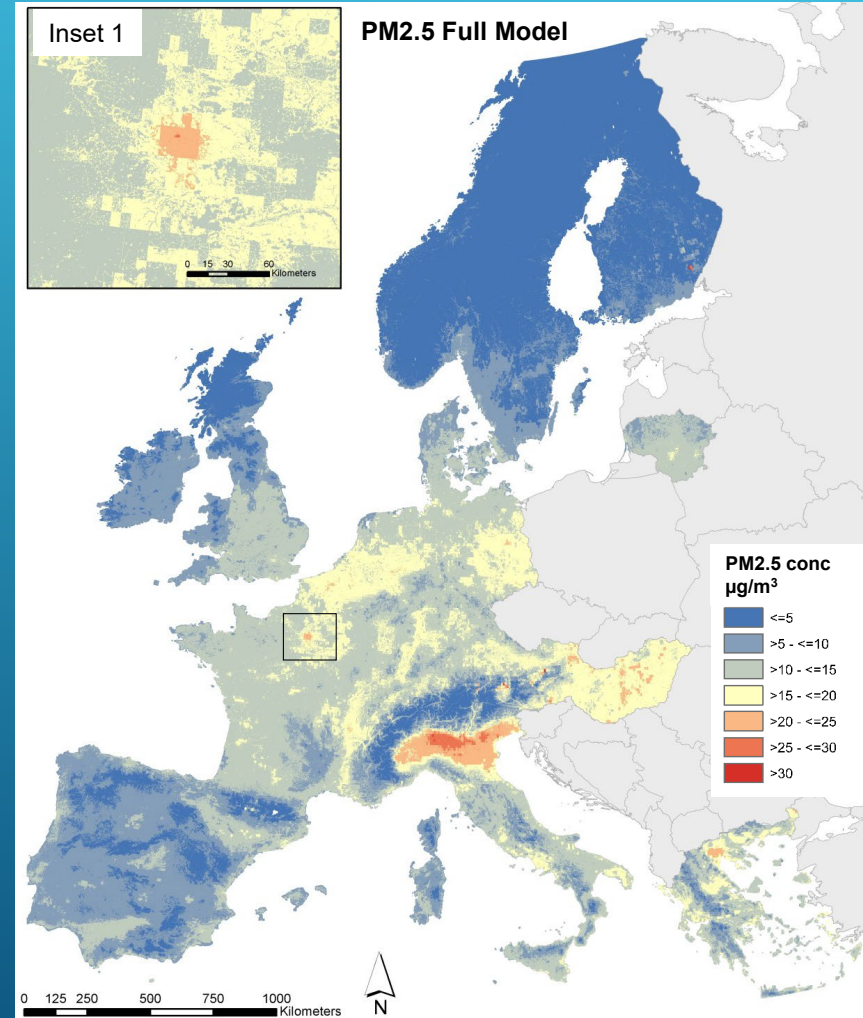

Europe-wide hybrid land use regression models

Land use and road data, with satellite observations and dispersion model estimates

Maps of 100x100 m grids

## Local exposure models

Existing LUR and/or dispersion models

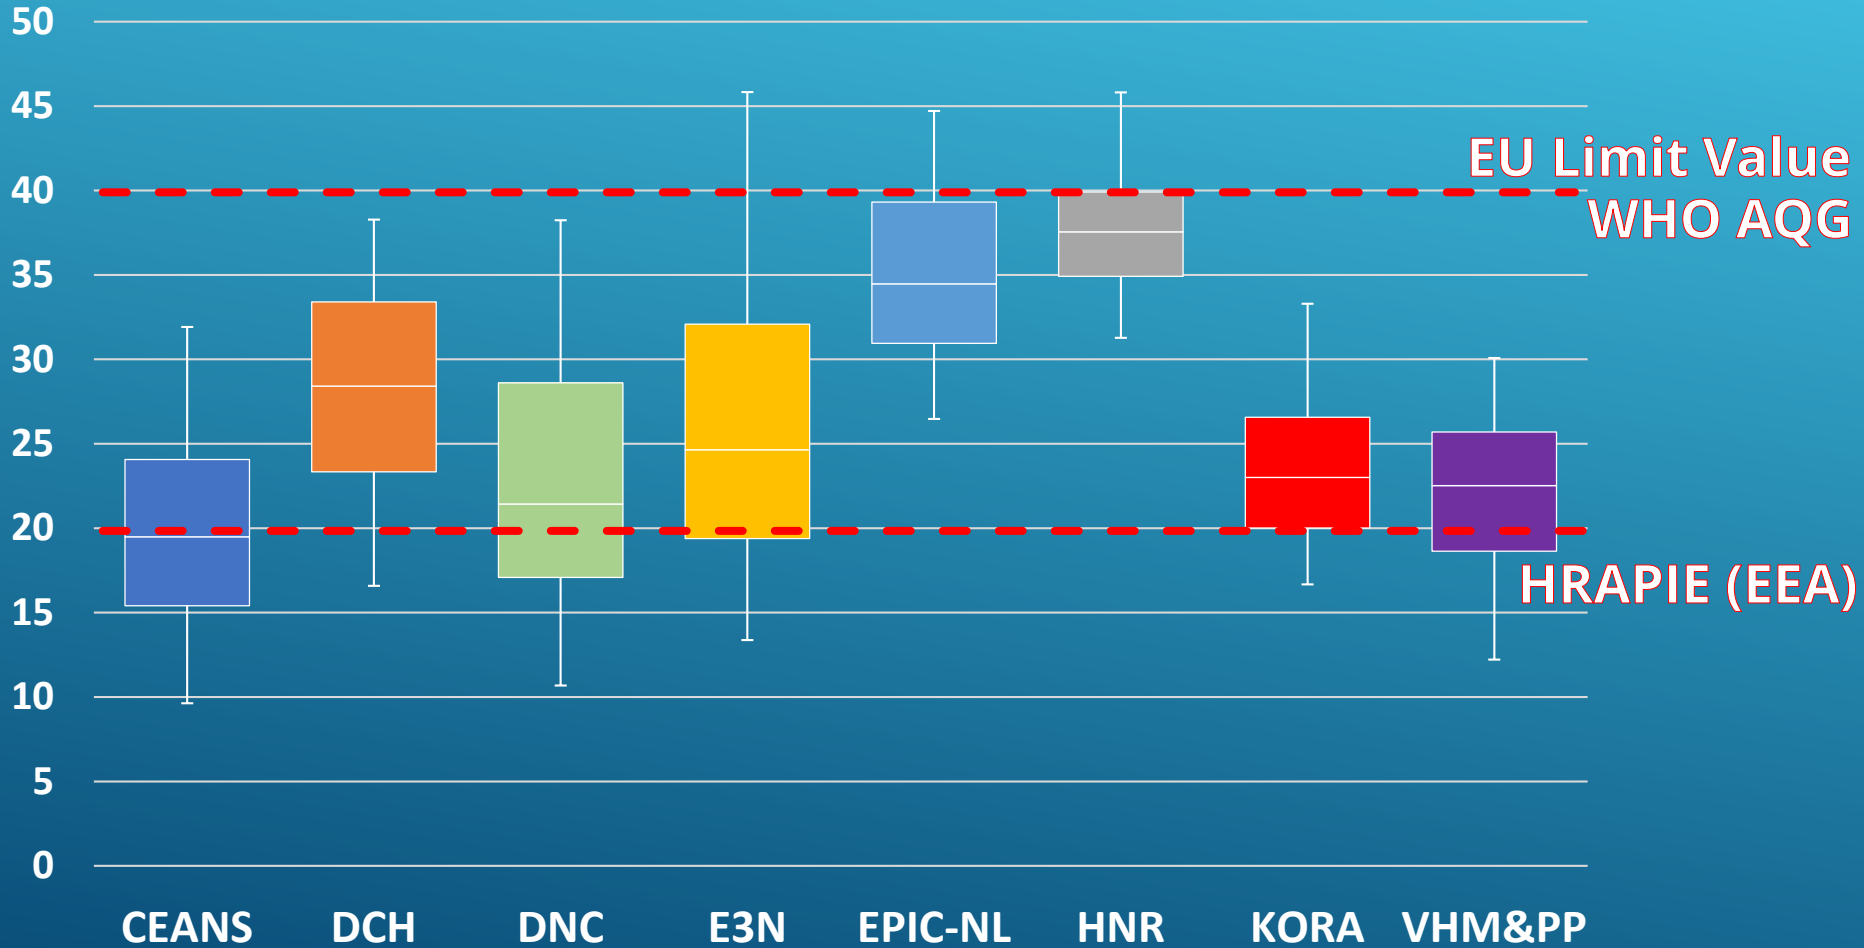

## Data analysis methods

- Cox proportional hazard models to investigate associations between air pollution and health, adjusting for individual and area -level confounders
- Shape of the concentration -response function
  - Natural and penalized splines
  - SCHIF functions
  - Subset and threshold analysis

# POOLED COHORT RESULTS

PM<sub>2.5</sub> (μg/m<sup>3</sup>)

$\text{NO}_2$  ( $\mu\text{g}/\text{m}^3$ )

## Correlations

Positive between PM<sub>2.5</sub>, BC and NO<sub>2</sub>

Negative between O<sub>3</sub> and PM<sub>2.5</sub>, BC and NO<sub>2</sub>

	NO <sub>2</sub>	BC	O <sub>3</sub>
PM <sub>2.5</sub>	.51 to .76	.50 to .70	-.41 to -.68
NO <sub>2</sub>		.86 to .93	-.67 to -.80
BC			-.64 to -.82

# ADMINISTRATIVE COHORTS RESULTS

## PM<sub>2.5</sub>

## NO<sub>2</sub>

## Take home message

- Long-term exposure to PM<sub>2.5</sub>, NO<sub>2</sub>, BC was positively **associated with morbidity and mortality** in the pooled cohort and seven large administrative cohorts
- HRs for PM<sub>2.5</sub> were somewhat larger in the pooled cohort (with detailed individual confounder info) than in the admin cohorts
- Associations **remain at low levels** :
  - < 10 μg/m<sup>3</sup> PM<sub>2.5</sub>
  - < 20 μg/m<sup>3</sup> NO<sub>2</sub>

# Next steps

- Associations with particle composition (Cu, Fe, Zn, S)
- PM2.5 estimates from MAPLE (Canadian study)
- Ozone at a larger spatial scale (modelled at 10 by 10 km and more as opposed to 100 \* 100 m)

THANK YOU
