

2025 Award Winners

*Jane Warren Awardees and Undergraduate
Summer Fellowship*

Health Effects Institute

HEI Summer Fellowship

A 10-week summer fellowship program with a stipend of \$8,000 that pairs highly qualified undergraduate students (rising juniors and seniors) with volunteer mentors in the United States.

Opportunity to gain hands-on environmental health research experience to build skills and explore potential career pathways.

Students prepare a research proposal, present their work, and engage in professional development seminars.

In partnership with ISEE and ISES and funded by the American Chemistry Council, the Clinton Family Foundation, and individual donors.

Summer Fellowship – Applications

| | 2023 Inaugural Year | 2024 | 2025 |
|-----------------------------------|------------------------|-----------|------------------|
| Applications | 52 | 81 | 168 |
| <i>Rising Juniors</i> | 29 | 36 | 80 |
| <i>Rising Seniors</i> | 23 | 45 | 88 |
| Number of Institutions | 30 | 48 | 96 |
| Number of States | 16 | 14 | 30 |
| Volunteer Mentors | 17 | 20 | 26 |
| Cohort Size | 7 fellows | 8 fellows | 9 fellows |

5% acceptance rate

Applications are reviewed based on motivation, skills, experience, and need for the opportunity.

Fellows come from a variety of majors primarily in the sciences, such as public health, environmental science, biology, chemistry, geography, and health informatics.

Steady growth of the program over time.

Summer Fellowship 2025

Olivia Alpizar
Rising Senior at
University of
Massachusetts, Amherst

Mentor: Elena Colicino,
Icahn School of Medicine

Kayla Portillo
Rising Junior at Boston
University

Mentor: Jonathan Levy,
*Boston University School
of Public Health*

Thet Mon Kyaw
Rising Senior at University
of Southern California

Mentor: Regan Patterson,
*University of California Los
Angeles*

**Elliot Lazarova-
Weng**
Rising Senior at University
of California, Santa Cruz

Mentor: Robin Dodson,
Silent Spring Institute

Peyton Morgan
Rising Senior at University
of North Carolina, Chapel
Hill

Mentor: Jennifer Richmond-
Bryant, *North Carolina State
University*

**Valeria Martinez-
Gutierrez**
Rising Senior at Syracuse
University

Mentor: Nicolas Lopez-
Galvez, *San Diego State
University*

**Autumn
Taliaferrow**
Rising Senior at Vassar
College

Mentor: Gary Adamkiewicz,
*Harvard T.H. Chan School
of Public Health*

Ahmed Shah
Rising Senior at University
of Rochester

Mentor: Kelvin Fong,
*George Washington
University*

**Sulaiman Mathew-
Wilson**
Rising Junior at Howard
University

Mentor: Colleen Rosales,
OpenAQ

HEI Jane Warren Award

The Jane Warren Award supports early career graduate students and postdocs in attending and presenting at the HEI Annual Conference.

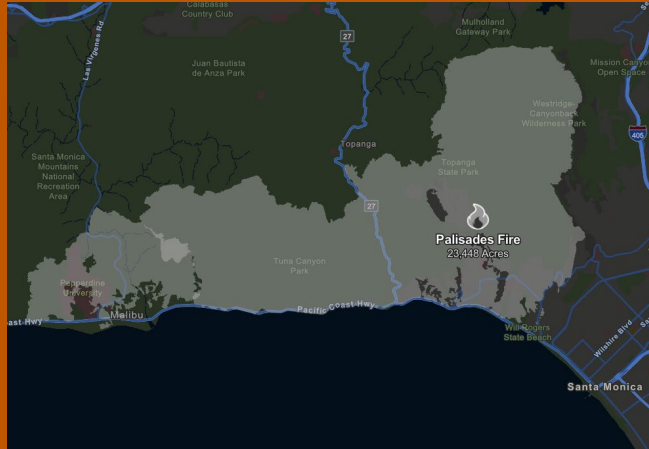

Up to 3 local researchers and 3 researchers based anywhere in the United States are selected each year for the award. The award covers registration costs for all awardees plus travel and accommodations for non-local winners. Winners present their work in a lightning talk and poster session during the conference.

The award is named in remembrance of Dr. Jane Warren who led HEI's scientific activities as the Director of Science from 1999 until her retirement in 2008.

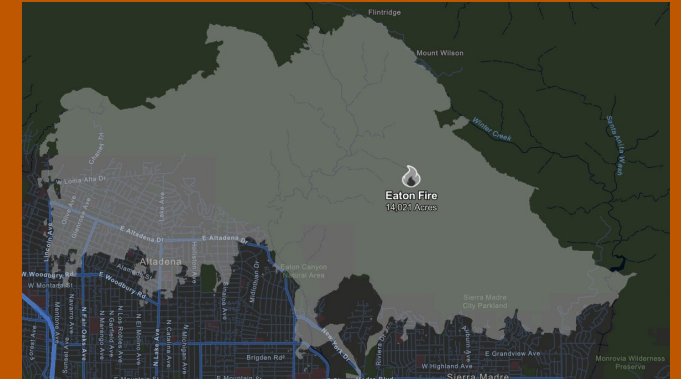

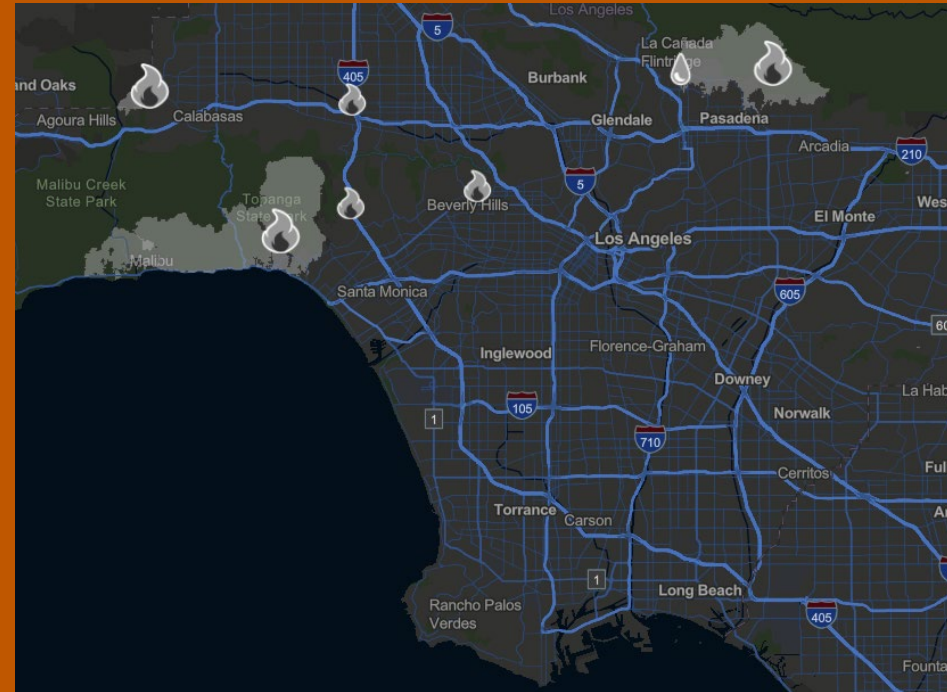

POLLUTANT EXPOSURE FOLLOWING FIRES AT THE WILDLAND URBAN INTERFACE

Early Insights from the Eaton and Palisades Fires

Sunday, Poster #15

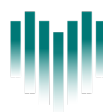

Neighborhood Measurements + Fuel Inventory

- > 1,300 miles of multi-hour drives
- Varying routes, weather, and times of day
- PM1 higher in Altadena (7 ug/m^3) than Palisades (4 ug/m^3), dominated by organic PM (85%)
- Upcoming Positive Matrix Factorization analysis

- 100 m x 100 m gridded inventory of fuel loadings
- Urban fuel calculation based on parcel data, Tax Assessor data, and fuel loading factors
- Can be compared against pollutant emissions

**LA FIRE
HEALTH
STUDY**

Spiegel Family Fund

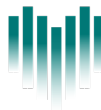

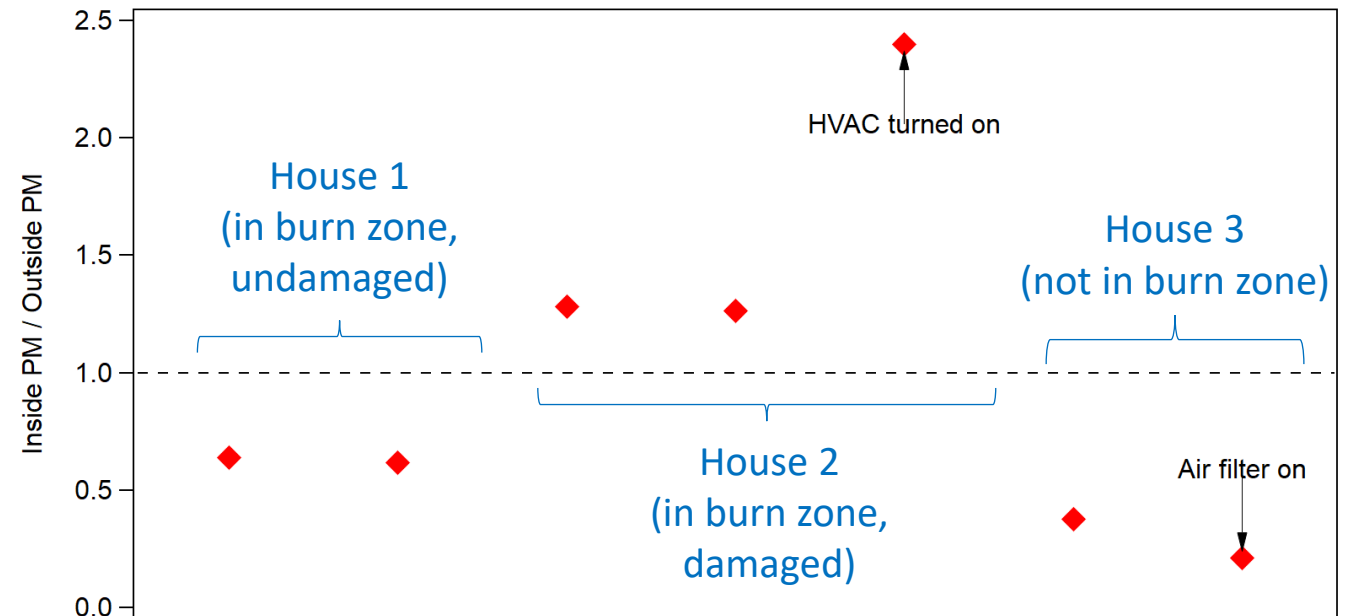

The University of Texas at Austin
McKetta Department
of Chemical Engineering
Cockrell School of Engineering

Sunday, Poster #15

Household Measurement: Sources & Sinks

- 11 volunteer homes with varying locations + damage
- Indoor/Outdoor Sample Switching
- Behavior of indoor/outdoor varied greatly between houses
- Filters potentially effective (PM1)
- Some elevated level of pollutants remained in HVAC systems

High-Resolution Urban Emission Mapping

Bridging Gaps Between Inventories and Hyperlocal Observations

Chirag Manchanda,^a Ronald C. Cohen,^a Ramon A. Alvarez,^b Tammy M. Thompson,^b Maria H. Harris,^b Julian D. Marshall,^c Alexander J. Turner,^c Robert A. Harley,^a Joshua S. Apte^a

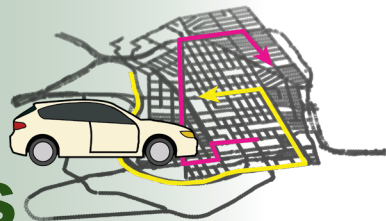

^a University of California, Berkeley, USA

^b Environmental Defense Fund, USA

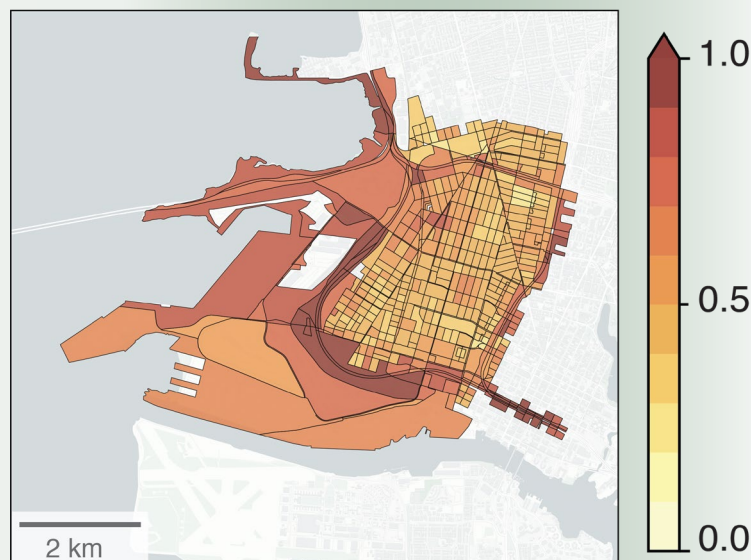

^c University of Washington, Seattle, USA

Hyperlocal Observations

BC Concentration ($\mu\text{g}/\text{m}^3$)

Fine-scale concentrations

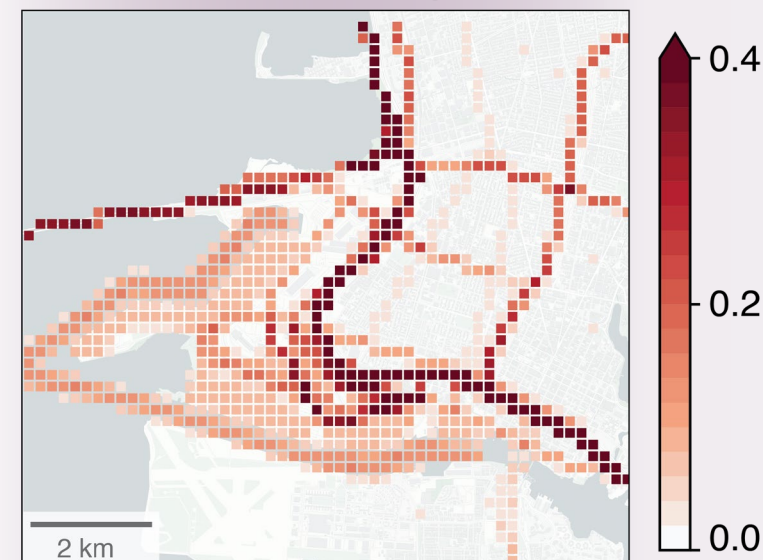

What impacts whom and by how much?

Bayesian Inverse Modeling

Requires spatiotemporally dense observations

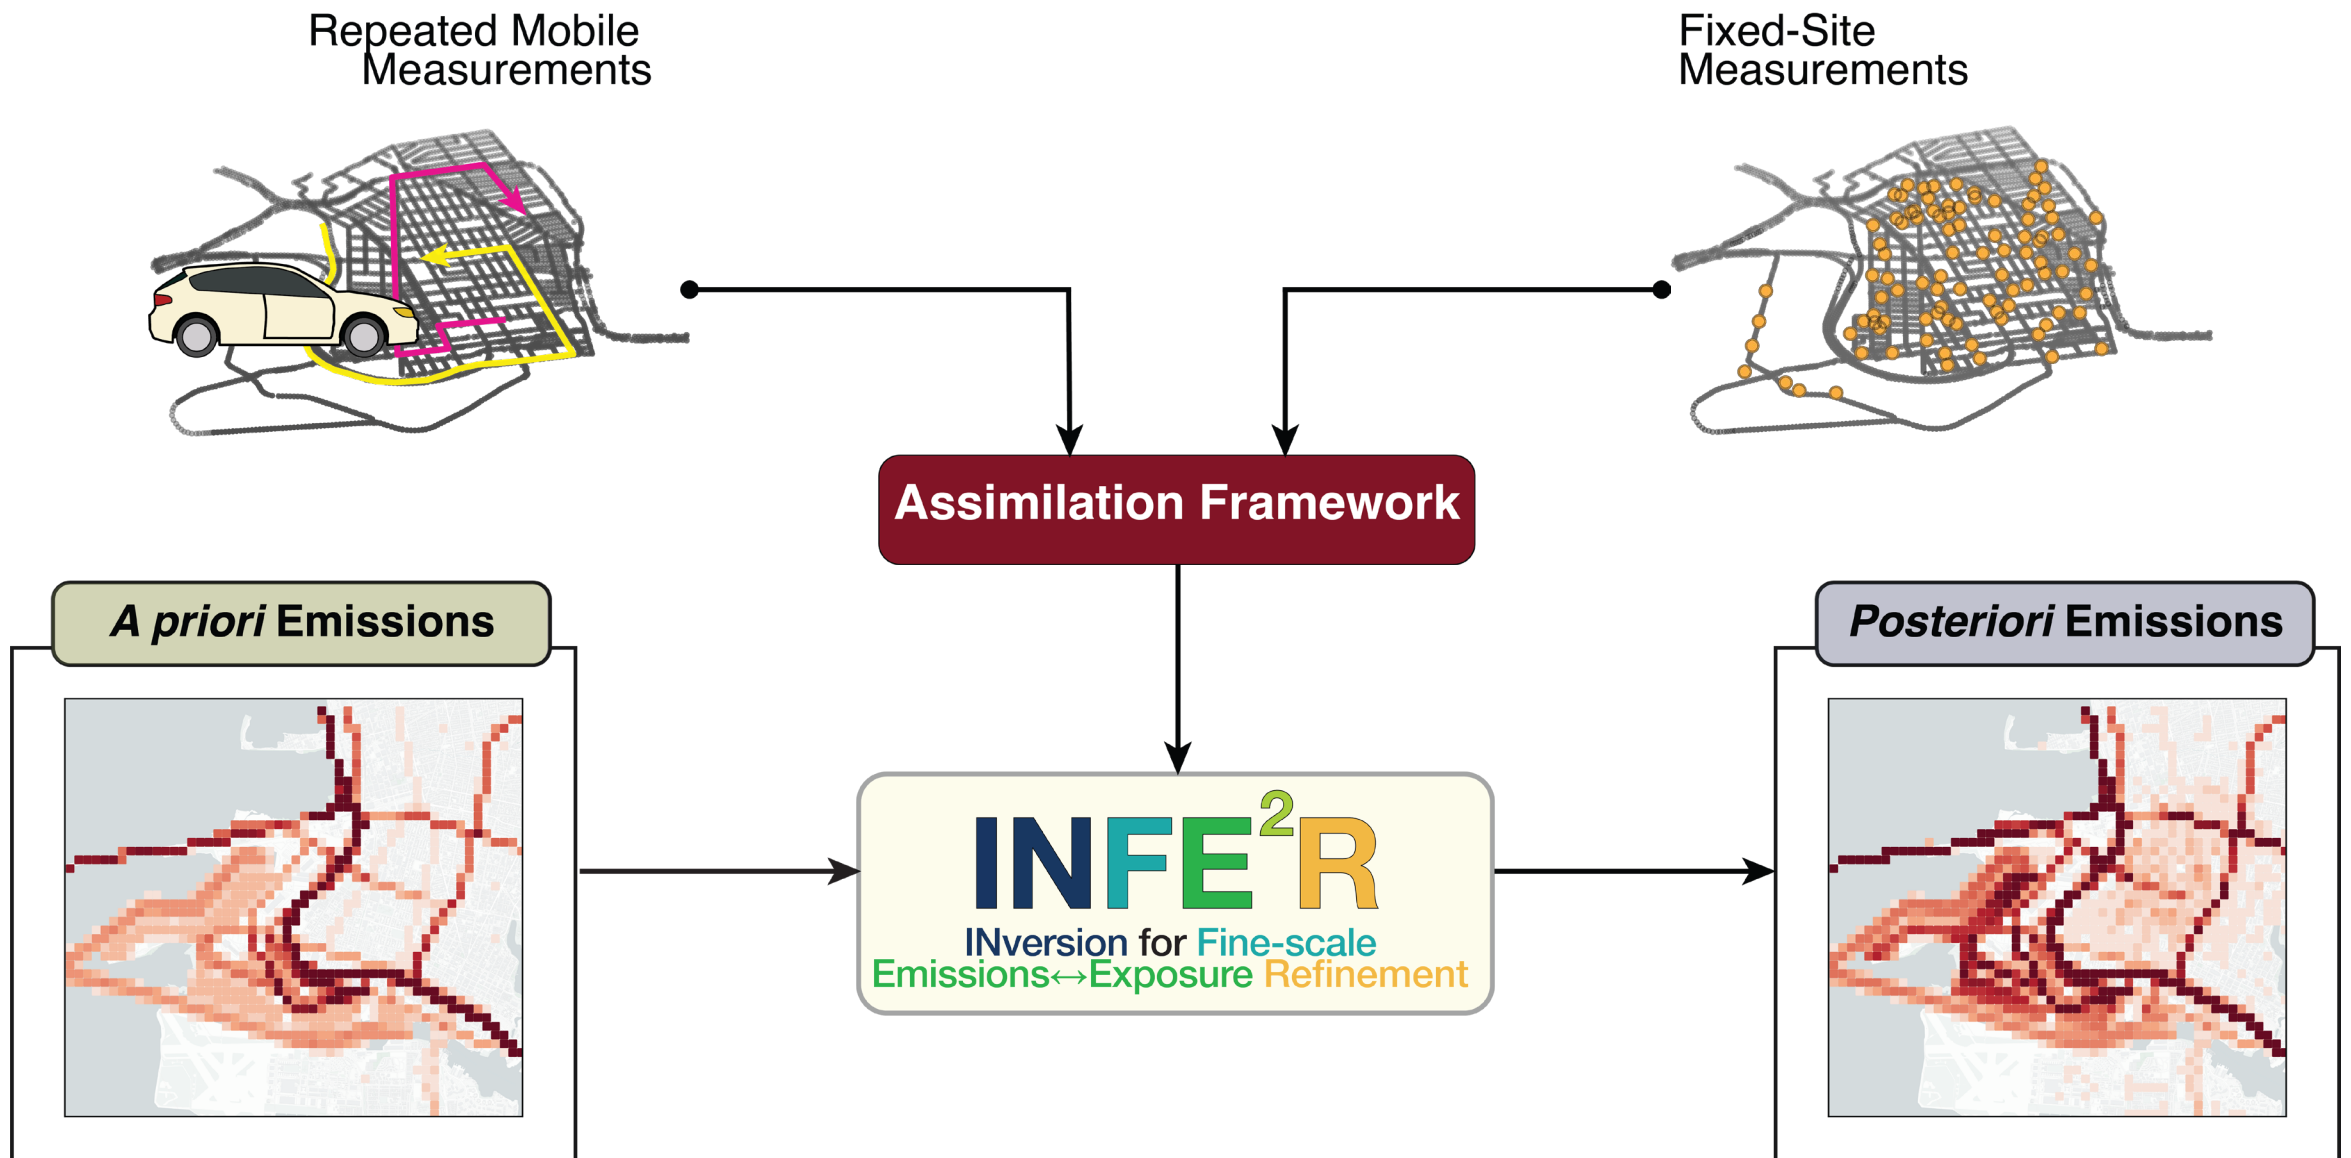

Emission Inventories

BC Emission Flux ($\text{kg h}^{-1} \text{km}^{-2}$)

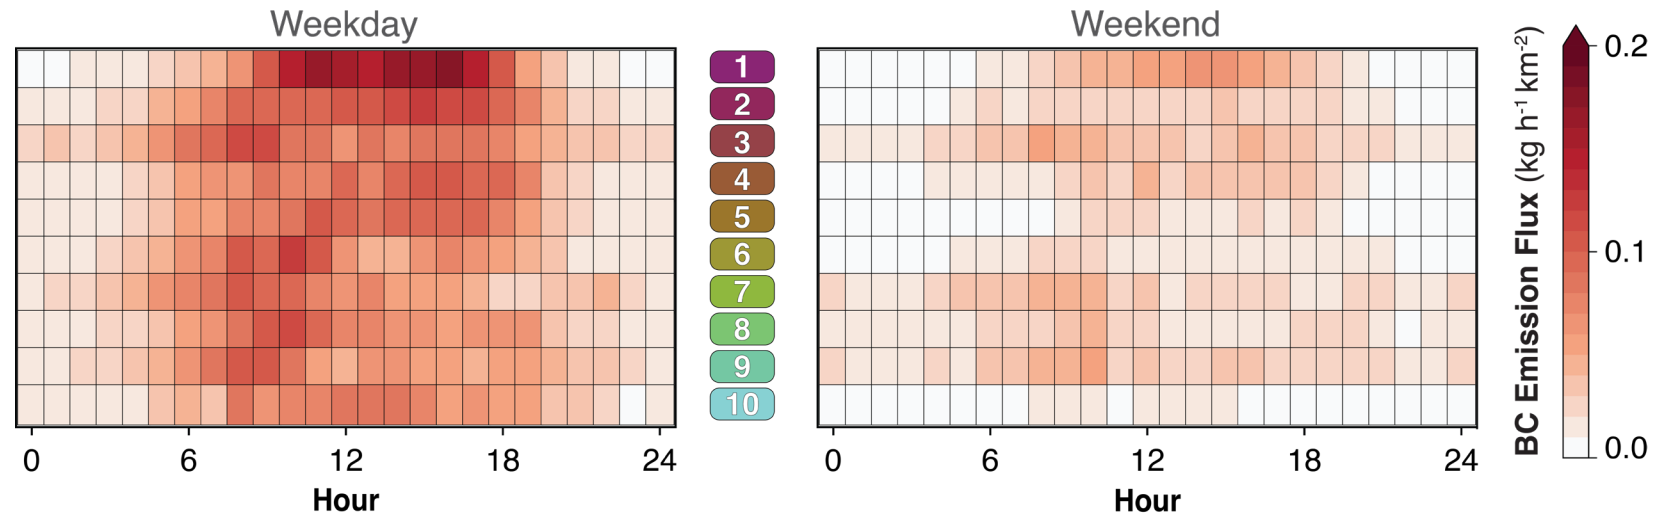

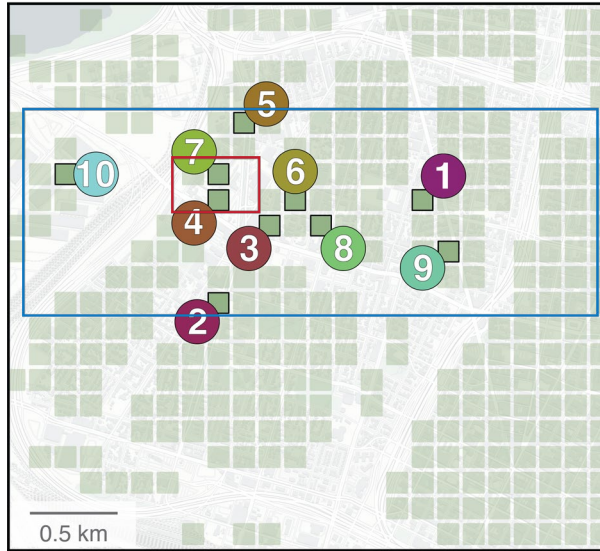

Inherently source resolved

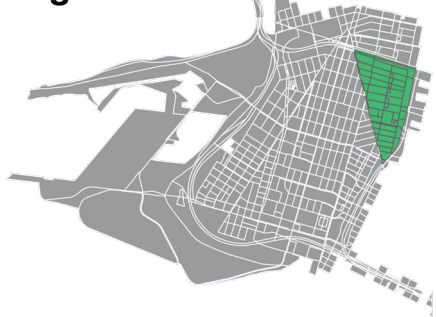

Missing sources
Misattributed contributions
Suboptimal mitigation

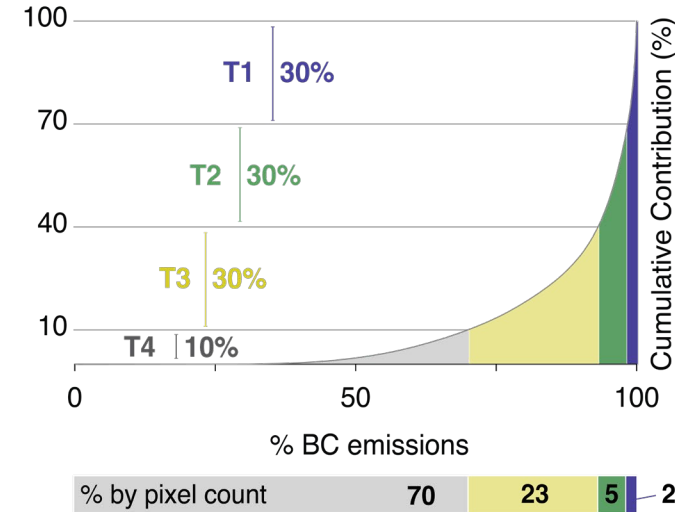

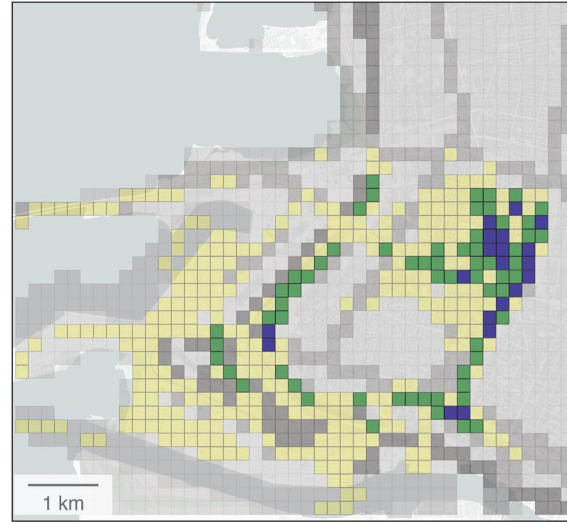

Neighborhood-scale point sources missing in emissions inventory

Hoover-Foster Neighborhood

Precise attribution of impacts back to emission sources

Disentangling Impacts:

Proximate – Low Emissions

Distant – High Emissions

TAKEAWAY

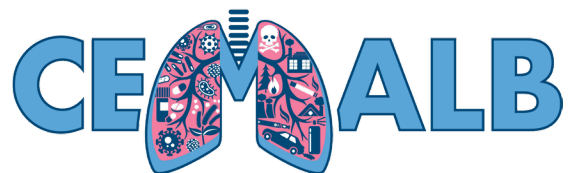

- Observationally constrained hyperlocal emission inventories.
- Measurement informed source attribution and mitigation impact assessment.
- Scalable and robust to observational and inventory errors.

Inhaled Vitamin D as a Protectant Against Air Pollution

Kevin Schichlein

Air Pollution is a Public Health Threat

Nearly 4 in 10 people in America live in places with unhealthy levels of air pollution

People of color are 2.3 times as likely as white people to live in a county with failing air quality grades

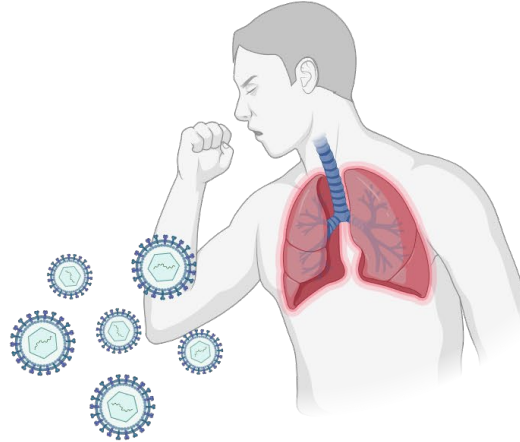

Climate change has led to increases in high pollution days and the number of wildfires

Strategies to mitigate the negative health effects of air pollution are needed

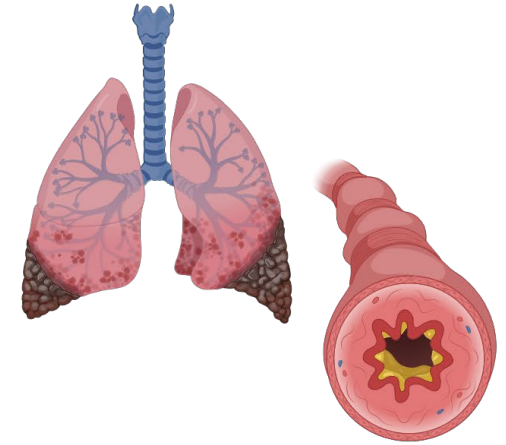

Vitamin D Deficiency and Lung Health

Air pollution associated with decreased levels of vitamin D

Vitamin D levels have been linked to severity and occurrence of respiratory infection

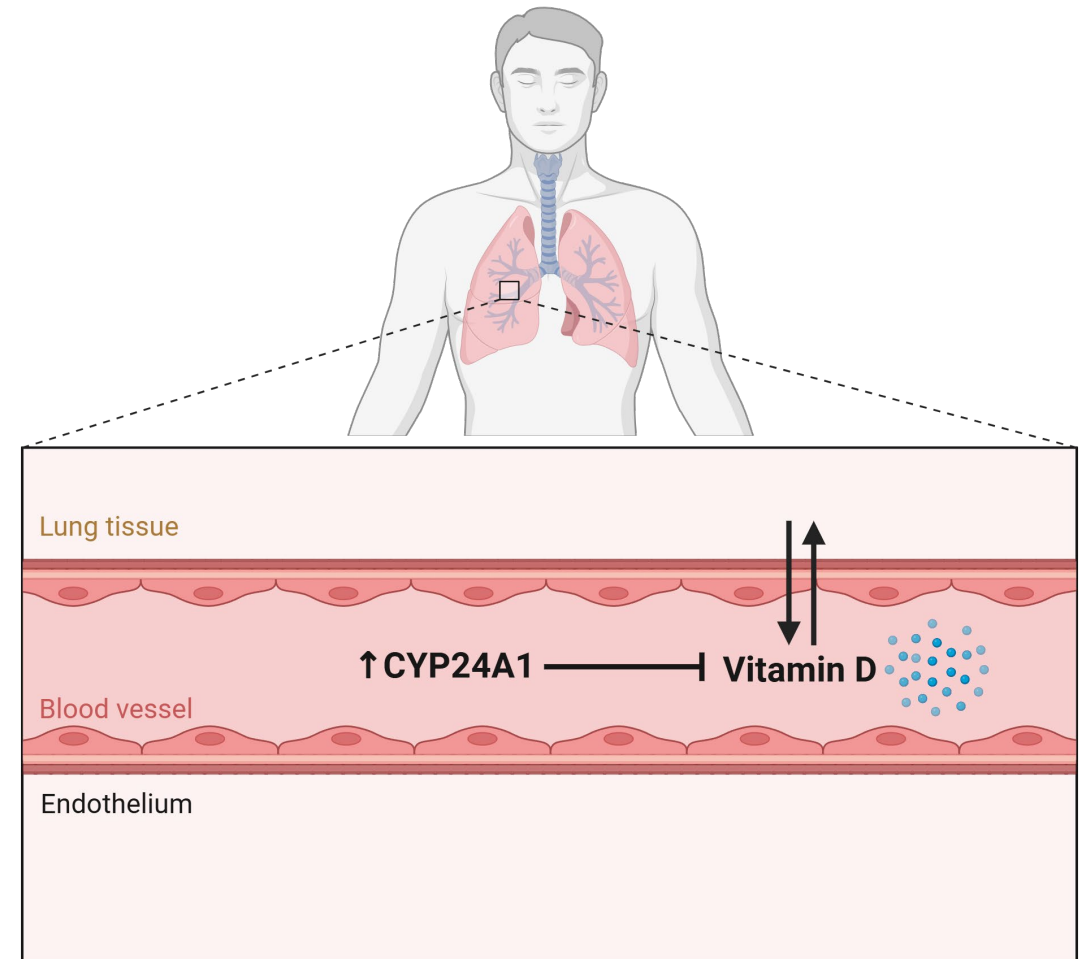

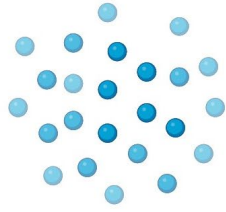

Vitamin D deficiency is characteristic of asthma, COPD, CF, and IPF

Why have studies of vitamin D supplementation to protect against lung pathologies failed?

Oral Supplementation Does Not Reach the Airway Epithelium

- The inactivating enzyme of vitamin D, CYP24A1, is highly expressed in the pulmonary endothelium
- Limits vitamin D entry into the airway epithelium
- **Inhaled vitamin D may allow for direct delivery to the airway epithelium**

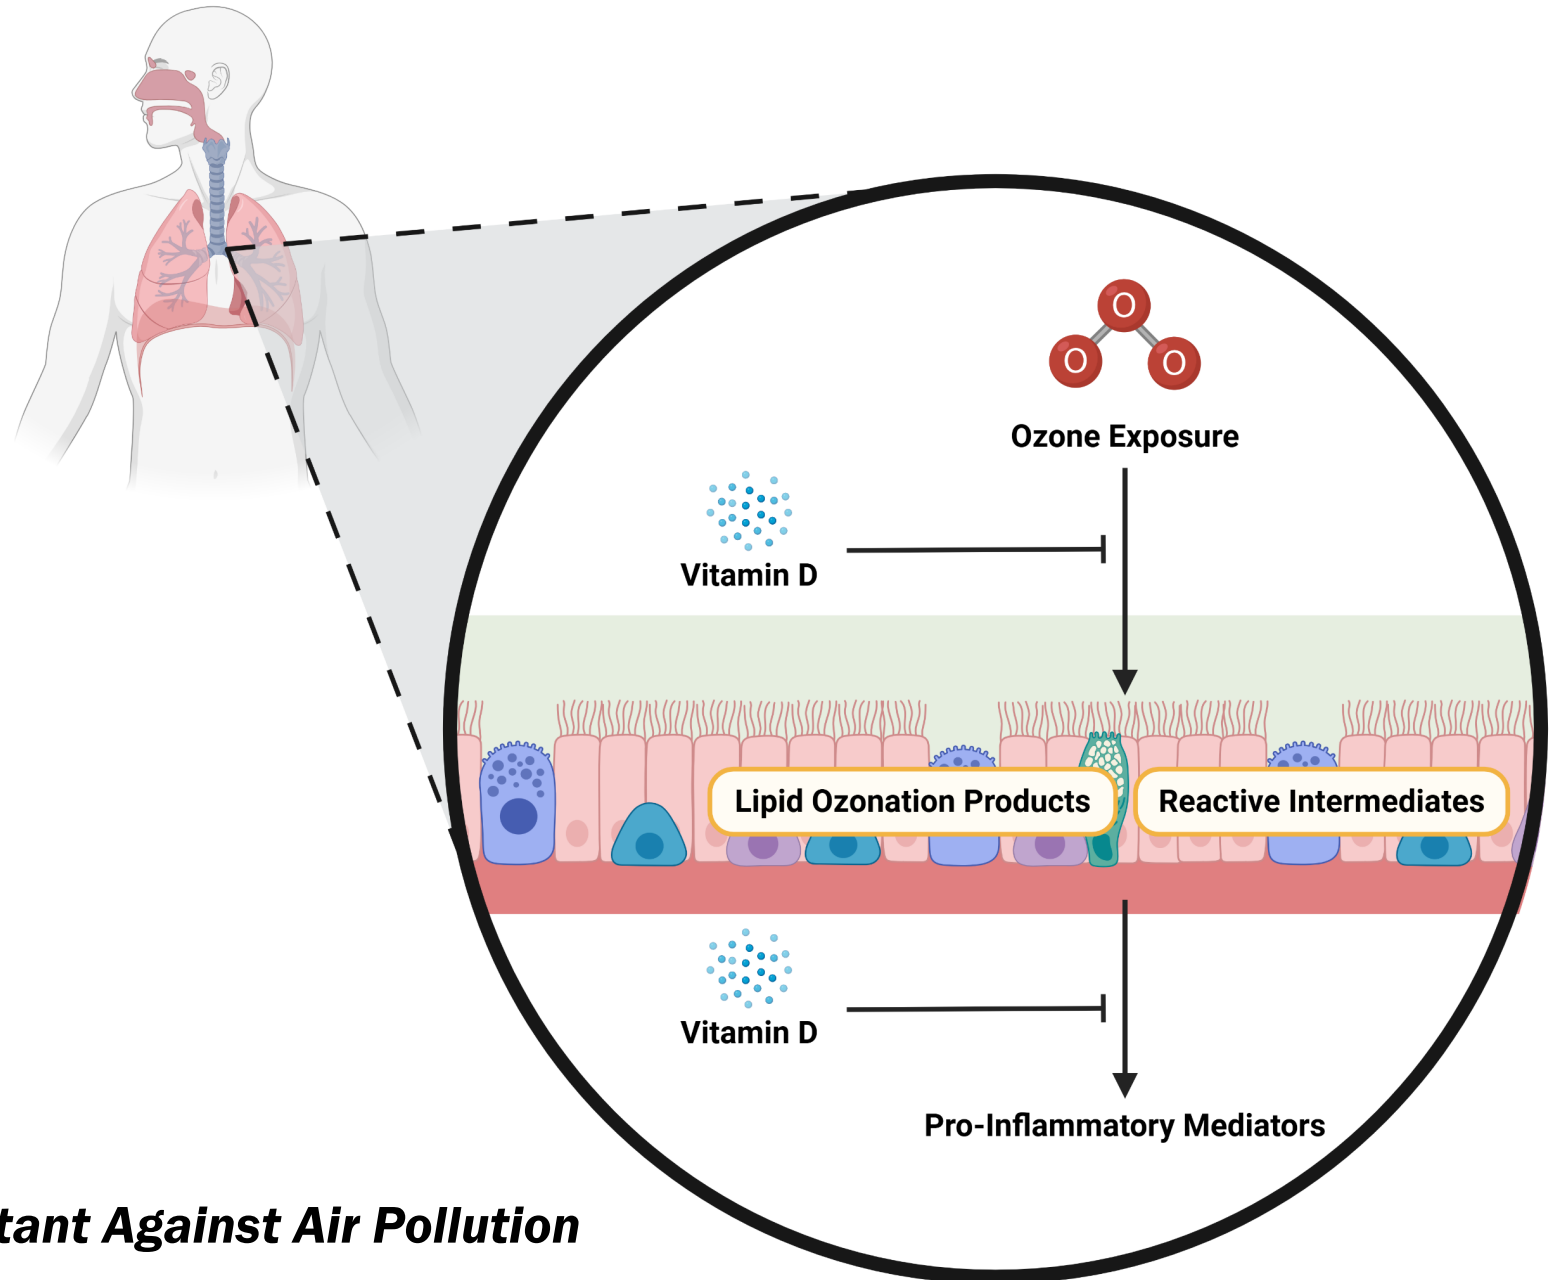

Vitamin D Aerosol

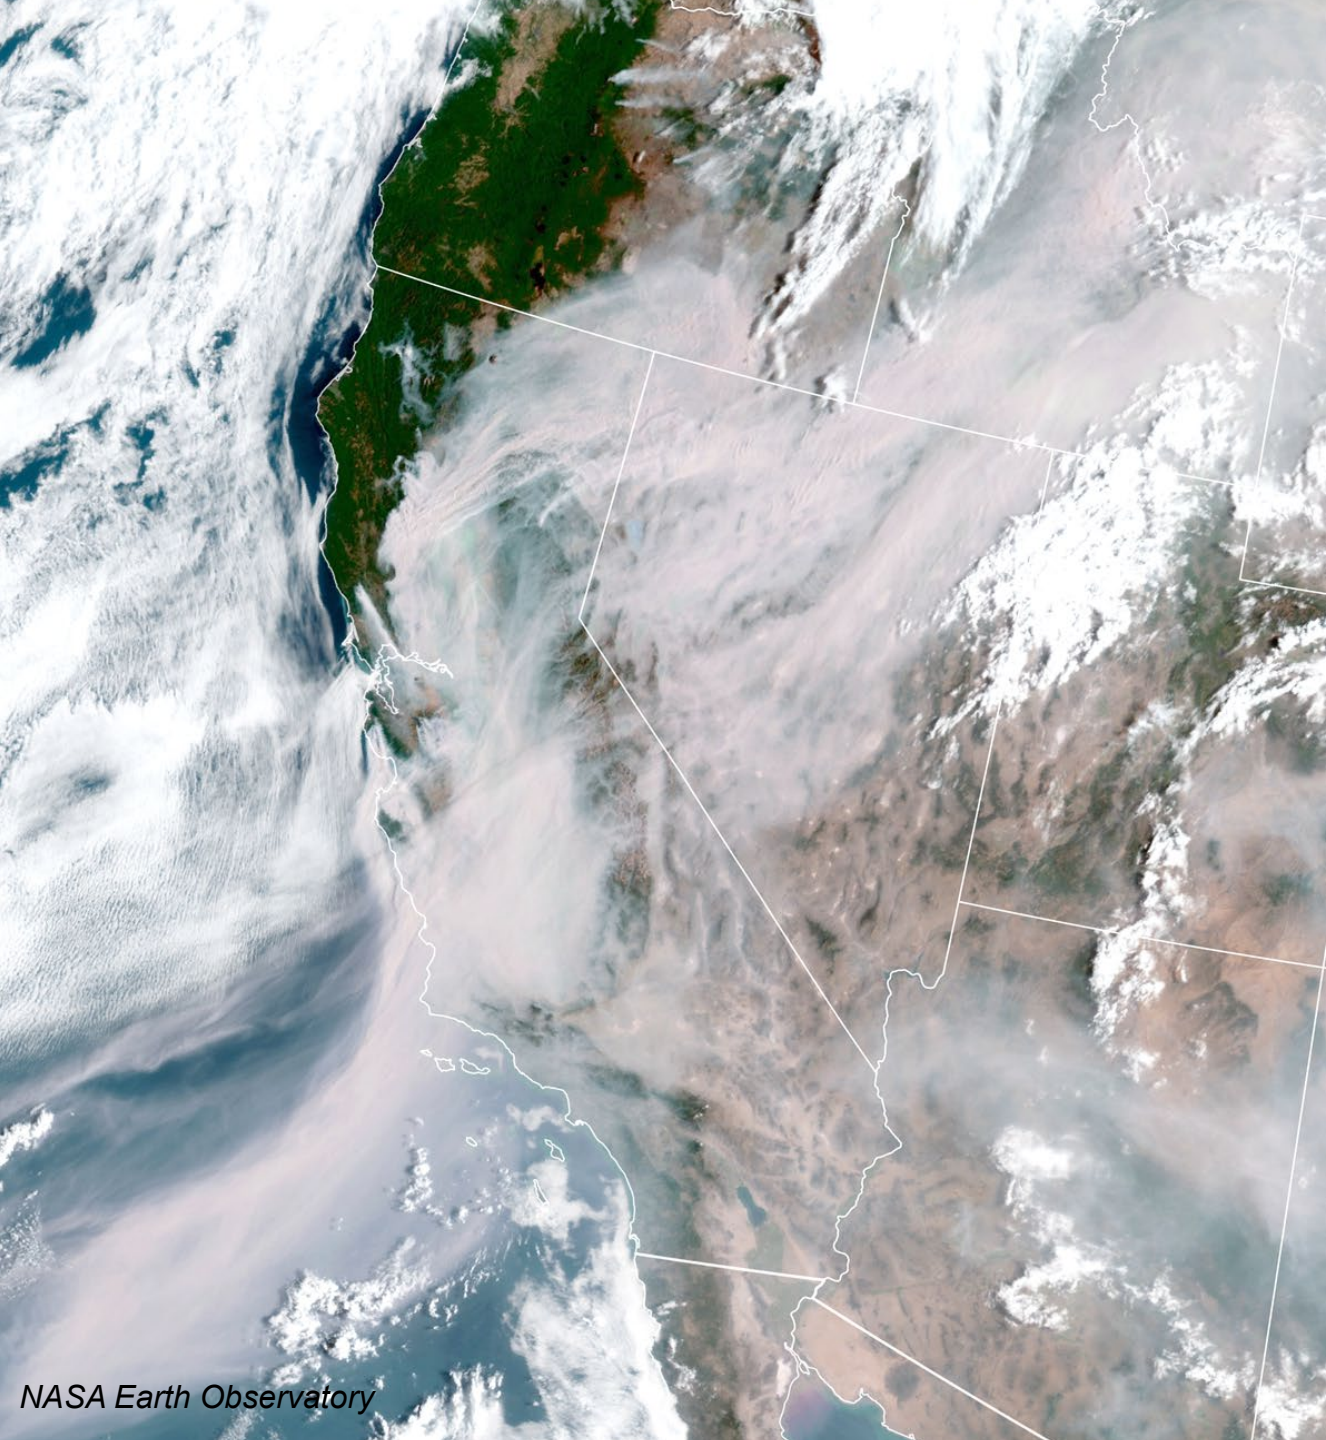

Air Pollution

**Can inhaled vitamin D
supplementation attenuate
pathological responses to ozone?**

Inhaled Vitamin D as a Protectant Against Air Pollution

Compounding Effects of Wildfire-Specific PM_{2.5} and Baseline Vulnerabilities on Pediatric Asthma in Northern California

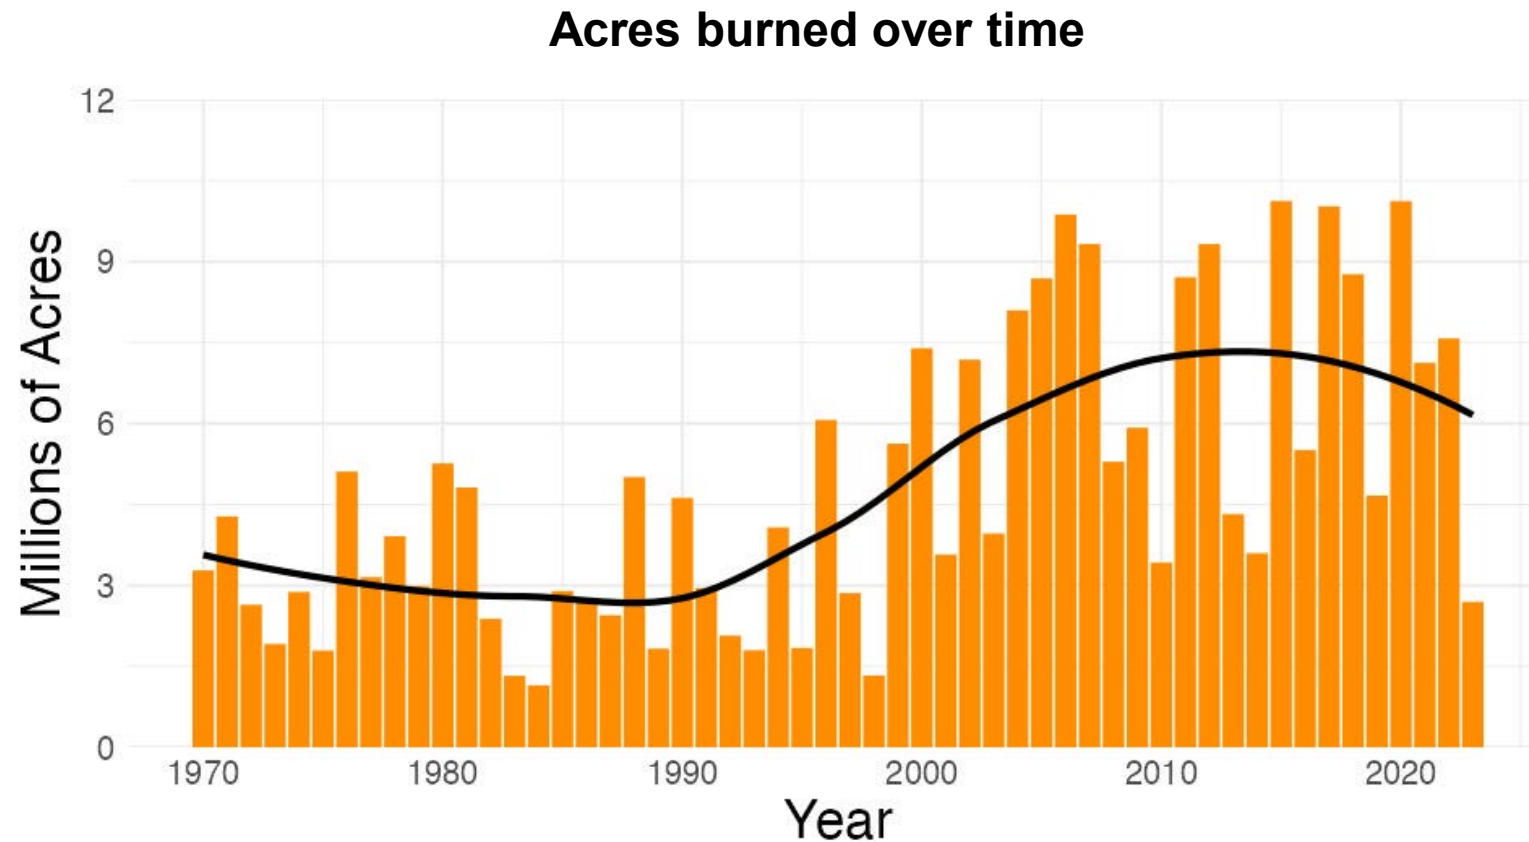

Rebecca Sugrue, PhD; Stephanie Holm, MD, PhD, MPH; Andrew Nguyen, MPH; Morgan Ye, MPH; Rosana Aguilera Becker, PhD; Dayna Long, MD; Tarik Benmarhnia, PhD; Rosemarie De La Rosa, PhD, MPH; Neeta Thakur, MD, MPH

Berkeley Public Health **UC San Diego**

Wildfire smoke events and their impact have increased

Increasing wildfire smoke events have resulted in further evidence linking smoke with exacerbations of respiratory disease

Goal: Determine the association between wildfire-specific $\text{PM}_{2.5}$ and asthma-related hospital visits among children in Alameda and Contra Costa Counties.

Developed distributed lag model to account for day-to-day influences

Analysis: The associations between wildfire-specific PM_{2.5} concentrations and daily counts of asthma-related hospital visits were estimated using a 6-day distributed lag model with random effect for census tract

Asthma-related hospitalizations ~ Wildfire PM_{2.5} + Temperature + Season + Population + Random effect for census tract

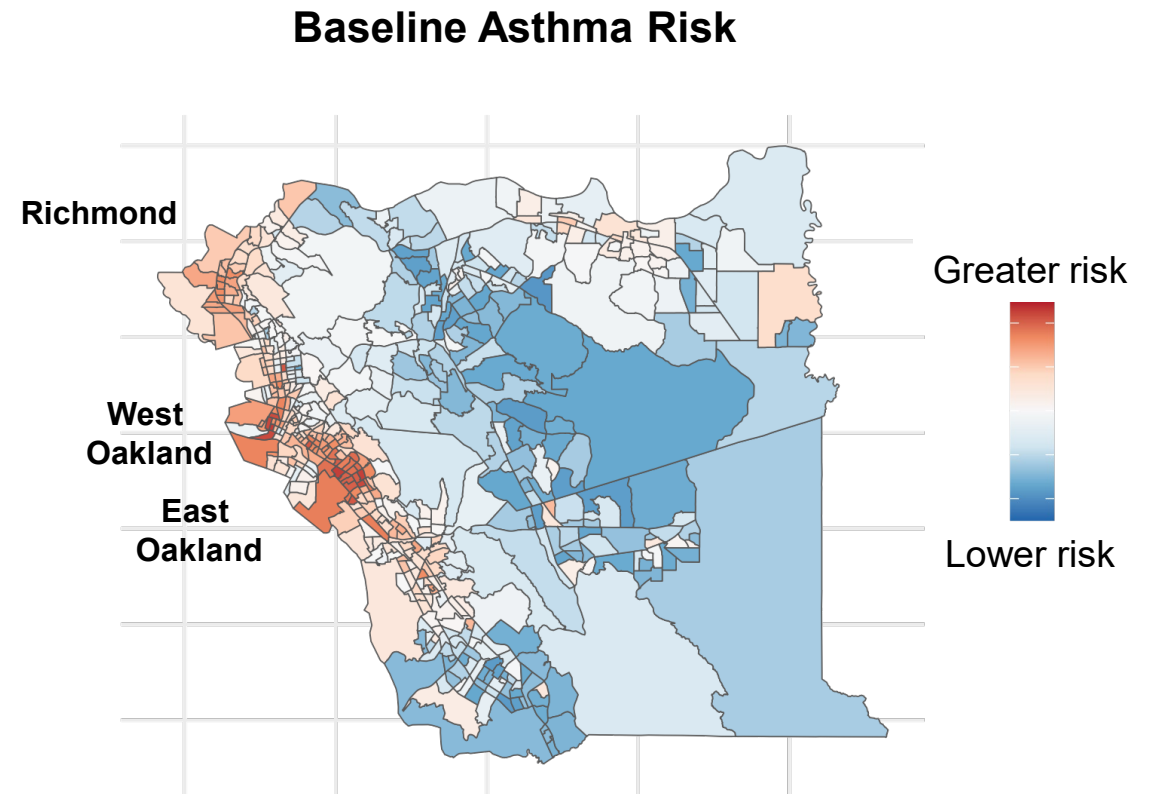

$$\log(\lambda_{it}) = \beta_0 + \beta_{WF} \cdot CB_{WF,it} + \beta_{Temp} \cdot CB_{Temp,it} + \beta_{Time} \cdot Time_t + Offset + u_i$$

i = census tract
 t = day

WF = wildfire PM_{2.5}
 $Temp$ = daily minimum temperature

Higher baseline risk in known vulnerable communities

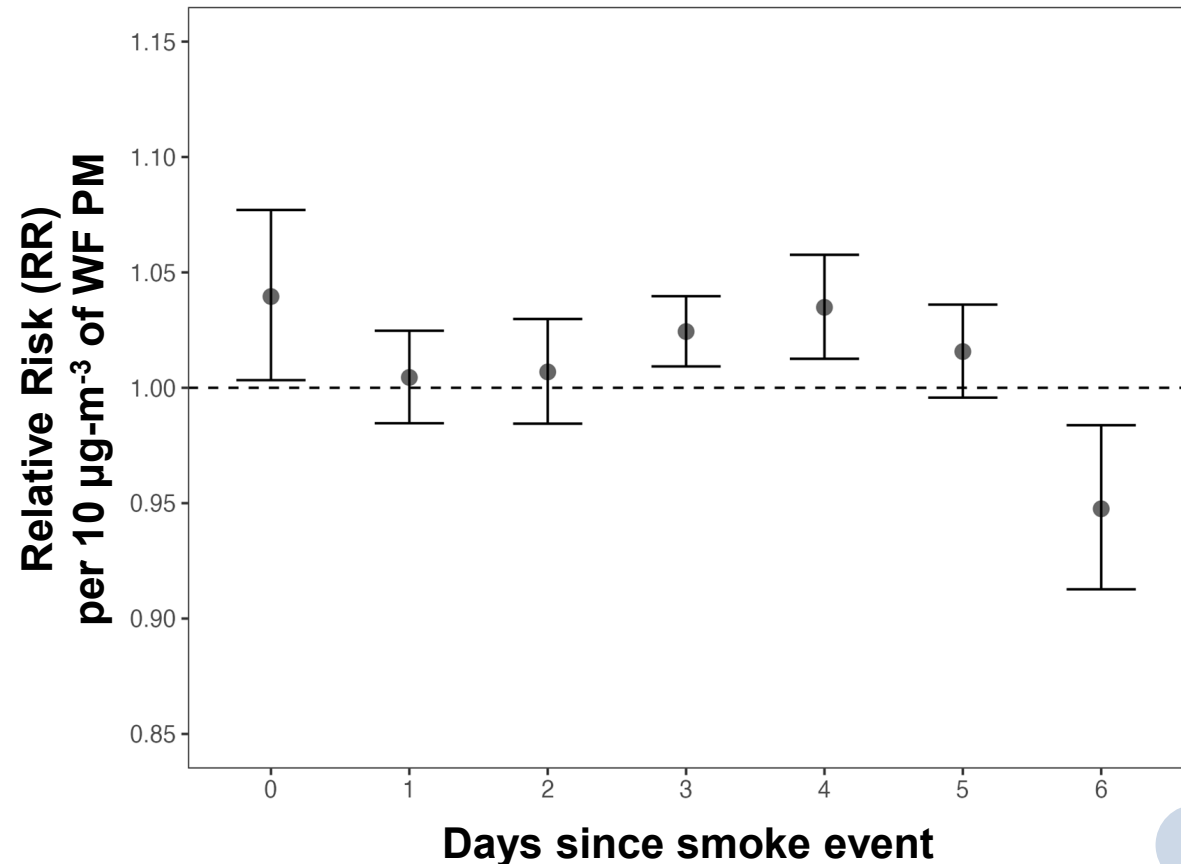

Spatial clusters with higher baseline risk to asthma-related hospitalizations are found in designated disadvantaged communities by CalEnviroScreen

Immediate and delayed increased risk due to wildfire smoke exposure

Wildfire smoke exposure was associated with increased risk of asthma-related hospital visits for **days 0, 3, and 4**

| Days since smoke event ↓ | RR per 10 $\mu\text{g}\cdot\text{m}^{-3}$ WF $\text{PM}_{2.5}$ | |
|-----------------------------|---|-------------------|
| | 0 | 1.04 (1.00, 1.08) |
| | 1 | 1.00 (0.98, 1.02) |
| | 2 | 1.01 (0.98, 1.03) |
| | 3 | 1.02 (1.01, 1.04) |
| | 4 | 1.04 (1.01, 1.06) |
| | 5 | 1.02 (0.99, 1.04) |
| 6 | 0.95 (0.91, 0.98) | |

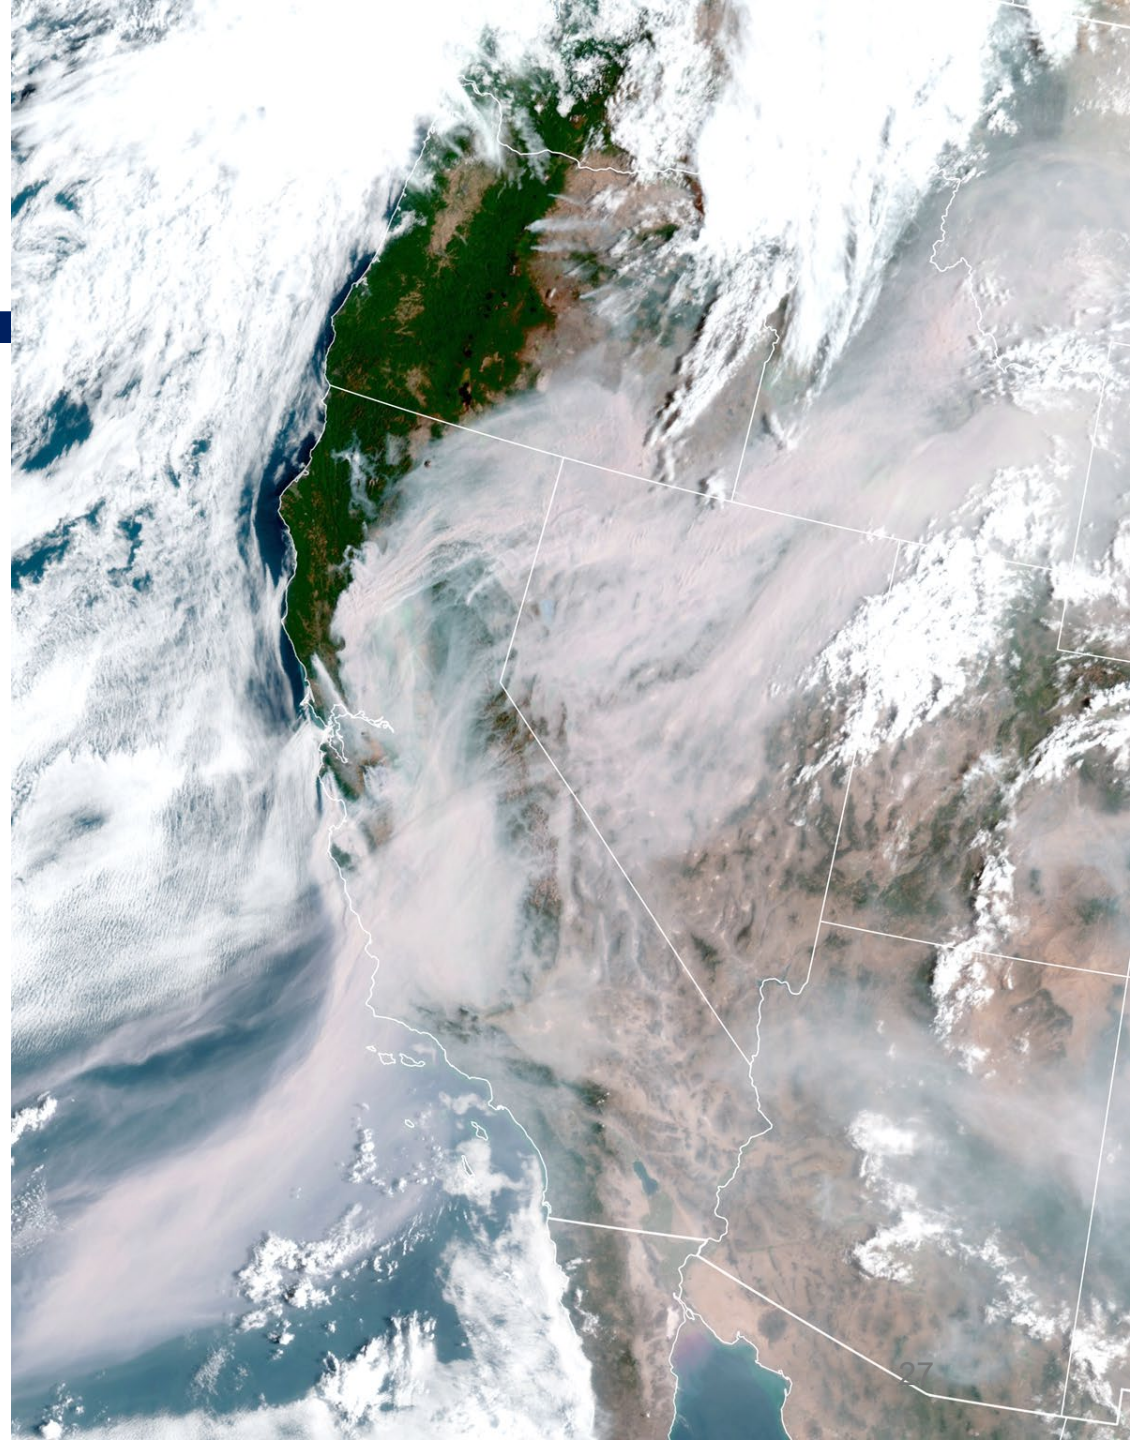

Takeaways

- Both the day of exposure and following days of wildfire smoke exposure have been found to be associated with asthma-related hospital visits of a pediatric population in Northern California

Next Steps

- Expanding the geographic scope and incorporating multiple healthcare settings
- Integrate qualitative methods to provide insights into the behavioral adaptations and community-level responses during wildfire events

Sources of Ozone, Particulate Matter, and Their Precursors in the El Paso Area
